

Green Lacewing (*Chrysoperla carnea*)

Eggs
Aphid Predators

Description

The adult Green Lacewing is 2 cm long. It has translucent oval wings and long antennae. The adult is crepuscular and feeds on pollen, nectar and aphid honeydew.

Lacewing larvae has an elongated body and strong mandibles. It is a voracious generalist predator that attacks several types of insects such as aphids, thrips, insects eggs and invertebrates.

Life cycle

- The development varies, according to the temperature, from 4 weeks to 3 months.
- The optimum conditions are a temperature of 20°C to 31°C and a relative humidity of 30% and more.
- Larvae emerge from the eggs after 3 to 6 days.
- A larva can consume 100 to 600 aphids during its development.
- Larval stage lasts 15 to 20 days.
- Pupation occurs on a leaf. The larva builds a small white cocoon. Adults emerge from it after 10 to 14 days.

Introduction rate

Introduction	Quantity	Surface	Frequency	Duration
Larvae				
Low infestation	10 larvae	per m ²	per 14 days	as needed
Hot spot	50 larvae	per m ²	per 7 days	as needed
Eggs				
Low infestation	20 eggs	per m ²	as needed	au besoin

Green Lacewing (*Chrysoperla carnea*)

Eggs
Aphid Predators

Application

Green Lacewing larvae are mainly used in cultivation of cannabis, vegetable crops (cucumbers and peppers), ornamental crops and in interior landscaping.

Introduce the egg yarns directly in aphid colonies or in the infested area. Avoid foliar applications of pesticides. Introduce at regular intervals until control.

Ants can attack lacewing eggs and larvae. This biological control agent does not establish itself in a greenhouse.

Formats

Container

- GL0042 - *Chrysoperla carnea* - 2000 eggs on jute yarn

Manual

1

The eggs are on the jute yarn. Handle carefully.

2

Open the container. Separate the yarn and place them on the foliage, near aphids or other pests.

3

Repeat until control.

Use upon receipt • Do not freeze • Do not refrigerate
